Europe in the AI network

Who does Europe build on, and who builds on Europe?

Group F
Ifeoluwa Adeboye · Sofiia Makhortova
Cintia Millan · Ella Tiihonen

Applied Network Analysis 2026

What is the network?

Nodes

AI **models**, **datasets** and **apps**

Links (directed)

A → B: A **is used to build** B

The Pile → **GPT-NeoX** → **GooseAI API**

dataset → model → app

> **Why we care:** we use AI apps every day, but the chain behind them is hidden.
>
> A few hubs in that chain can shape much of what is built on top of them.

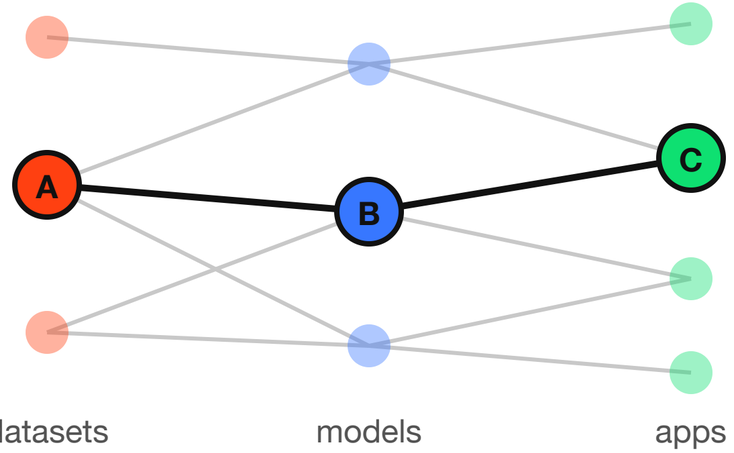

Figure 1. Illustration: the example chain in a wider network

How do we collect the data?

1 Stanford researchers document AI assets and what each is built from

2 The records are public on GitHub. We freeze one release

3 Each record becomes a node; each “built from” entry a link

4 We clean the names and add outside sources, like Wikipedia

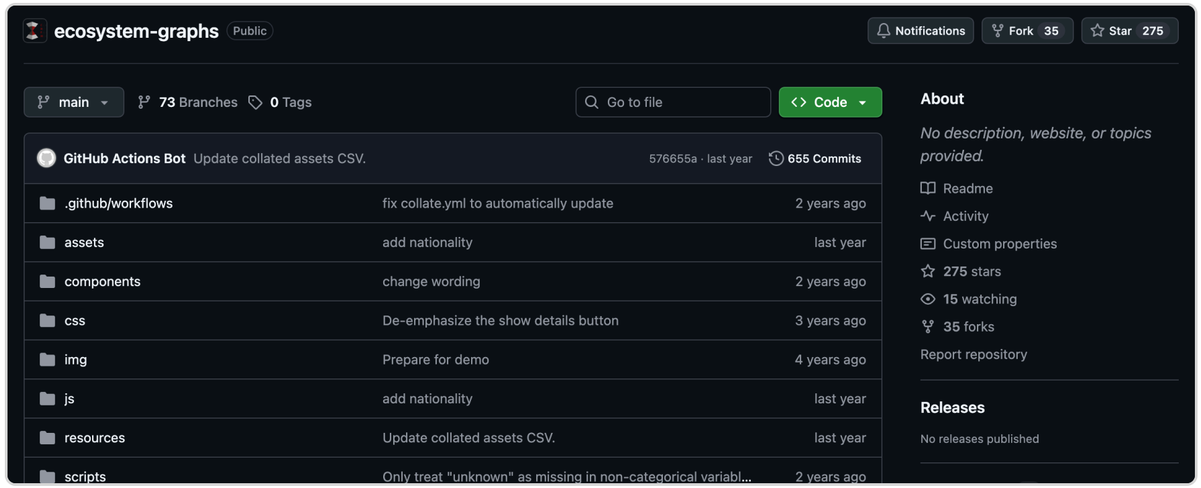

Figure 2. github.com/stanford-crfm/ecosystem-graphs

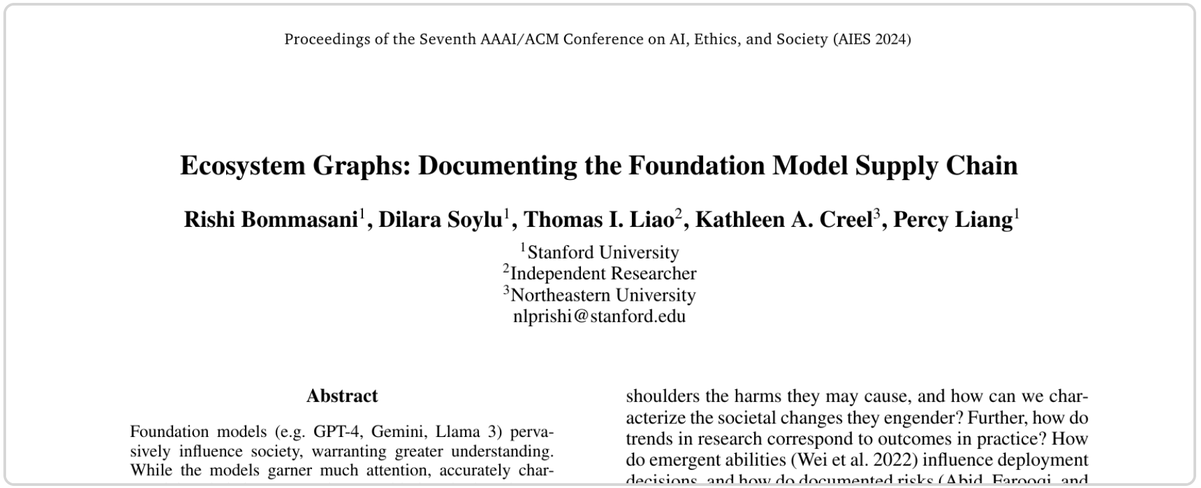

Figure 3. Bommasani et al. (2024), Ecosystem Graphs, AIES

Each node keeps: type, organisation, date, access, licence

How big is it?

742 nodes (N)

751 links (L)

359 models · **112** datasets · **97** apps · **174** outside sources

AI built up to April 2024

Estimate for today

N ≈ 1,600–3,400 · L ≈ 1,600–4,900

If it kept the growth of its last 12 months

What will we ask?

1	**Who does Europe build on?**	tag 194 organisations by region
2	**Who builds on Europe?**	follow links out of European nodes
3	**Which hubs hold it up?**	centrality, then test removing hubs
4	**How did it change, 2019 → 2024?**	yearly snapshots, vs a random null model
